

A

Bounded shear-mixing imbalance diagnostic

Scalar SMII is an enrichment diagnostic; the BLH-shear state-space benchmark remains primary.

Simple SMII

$$\begin{aligned} & z(\log(1 + S)) \\ & - z(\log(1 + BLH)) \end{aligned}$$

Constrained SMII

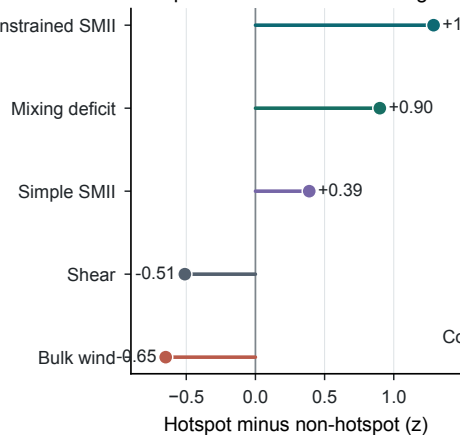

$$\begin{aligned} & -z(\log(1 + BLH)) \\ & + z(\log(1 + S / BLH)) \end{aligned}$$

Primary test

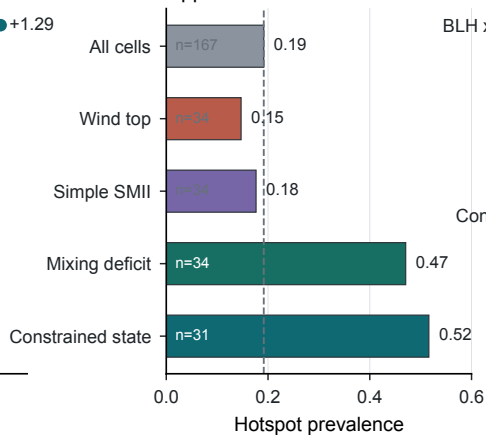

BLH-shear phase state
plus interaction benchmark

Observation unit: city-state-response cell; $n = 167$, hotspot rows = 32. All z-scores use the finite cell table.

B Hotspot cells are shallow-mixing states

C Upper-state enrichment

D State-space model remains strongest
